

Some doctors won't see patients with anti-vaccine views

January 29 2015, by Alicia Chang

With California gripped by a measles outbreak, Dr. Charles Goodman posted a clear notice in his waiting room and on Facebook: His practice will no longer see children whose parents won't get them vaccinated.

It's a sentiment echoed by a small number of doctors who in recent years have "fired" patients who continue to believe debunked research linking vaccines to autism. They hope the strategy will lead parents to change their minds; if that fails, they hope it will at least reduce the risk to other children in the office.

"Parents who choose not to give measles shots, they're not just putting their kids at risk, but they're also putting other kids at risk—especially kids in my waiting room," the Los Angeles pediatrician said.

The tough-love approach—which comes amid the nation's second-biggest [measles outbreak](#) in at least 15 years, with 95 cases or more since last month, most of them traced directly or indirectly to Disneyland in Southern California—raises questions about doctors' ethical responsibilities.

The American Academy of Pediatrics says doctors should bring up the importance of vaccinations during visits but should respect a parent's wishes unless there's a significant risk to the child.

"In general, pediatricians should avoid discharging patients from their practices solely because a parent refuses to immunize his or her child,"

according to guidelines issued by the group.

However, if the relationship between patient and doctor becomes unworkable, the pediatrics academy says, the doctor may want to encourage the vaccine refuser to go to another physician.

Some mothers who have been dropped by their doctors feel "betrayed and upset," said Dotty Hagmier, founder of the support group Moms in Charge. She said these parents made up their minds about vaccines after "careful research and diligence to understand the risks versus the benefits for their own children's circumstances."

Dropping patients who refuse vaccines has become a hot topic of discussion on SERMO, an online doctor hangout. Some [doctors](#) are adamant about not accepting patients who don't believe in vaccinations, with some saying they don't want to be responsible for someone's death from an illness that was preventable.

Others warn that refusing treatment to such people will just send them into the arms of quacks.

The measles-mumps-rubella [vaccine](#), or MMR, is 97 percent effective at preventing measles, according to the Centers for Disease Control and Prevention.

Measles spreads easily through the air and in enclosed spaces. Symptoms include fever, runny nose, cough and a rash all over the body. In rare cases, particularly among babies, measles can be deadly. Infection can also cause pregnant women to miscarry or give birth prematurely.

All U.S. states require children to get certain vaccinations to enroll in school. California is among 20 states that let parents opt out by obtaining personal belief waivers. Some people worry that vaccines cause

developmental problems, despite scientific evidence disproving any link. Others object for religious or philosophical reasons.

Nationally, childhood measles vaccination rates have held steady for years at above 90 percent. But there seem to be growing pockets of unvaccinated people in scattered communities, said Dr. Gregory Wallace of the CDC.
