

Physicians and burnout: It's getting worse

December 1 2015

Burnout among U.S. physicians is getting worse. An update from a three-year study evaluating burnout and work-life balance shows that American physicians are worse off today than they were three years earlier. These dimensions remained largely unchanged among U.S. workers in general, resulting in a widening gap between physicians and workers in other fields. The study conducted by Mayo Clinic researchers

in partnership with the American Medical Association compared data from 2014 to metrics they collected in 2011 and found that now more than half of U.S. physicians are experiencing professional burnout. The findings appear in *Mayo Clinic Proceedings*.

"Burnout manifests as emotional exhaustion, loss of meaning in work, and feelings of ineffectiveness," says Tait Shanafelt, M.D. "What we found is that more physicians in almost every specialty are feeling this way and that's not good for them, their families, the medical profession, or patients."

The researchers say evidence indicates that burnout leads to poor care, physician turnover and a decline in the overall quality of the health care system. In the 2011 survey 45 percent of physicians met the burnout criteria, with highest rates occurring in the "front lines"—general internal medicine, family medicine and emergency medicine. In 2014, 54 percent of responding physicians had at least one symptom of burnout. Satisfaction with [work-life balance](#) also declined. The survey results were based on 6,880 physicians across the United States, a 19 percent response rate, as well as a population based sample of 5313 working U.S. adults in other fields.

In a snapshot:

- Physician burnout is up 10 percent over the last three years
- Burnout rates are up across almost all specialties
- No overall increase in physician work hours was reported
- No increase in rates of depression was observed among physicians

Researchers say the problem of physician burnout is largely a system issue and that health care organizations have a shared responsibility in addressing the problem. They say more needs to be done by healthcare

organizations to help physicians by improving the efficiency of the practice environment, reducing clerical burden, and providing [physicians](#) greater flexibility and control over work.

What must be done:

- Urgent need for research to provide "evidence-based interventions" addressing [burnout](#), including improving efficiency
- Factors in the practice or work environment have to change
- Offering self-help solutions is no longer enough
