

10 percent of U.S. adults meet vegetable intake recommendations

January 7 2022

(HealthDay)—Only 12.3 and 10.0 percent of U.S. adults met the fruit

and vegetable intake recommendations, respectively, in 2019, according to research published in the Jan. 7 issue of the U.S. Centers for Disease Control and Prevention *Morbidity and Mortality Weekly Report*.

Seung Hee Lee, Ph.D., from the CDC in Atlanta, and colleagues used the 2019 Behavioral Risk Factor Surveillance system data to estimate the percentage of adults who met fruit and vegetable intake recommendations overall and by sociodemographic characteristics for 49 states and the District of Columbia.

The researchers found that 12.3 and 10.0 percent of adults met fruit and vegetable recommendations, respectively, ranging from 8.4 to 16.1 percent in West Virginia and Connecticut and from 5.6 to 16.0 percent in Kentucky and Vermont, respectively. Hispanic adults had the highest prevalence of meeting fruit intake recommendations (16.4 percent), while men had the lowest prevalence (10.1 percent). Adults aged 51 years and older had the highest prevalence of meeting vegetable intake recommendations (12.5 percent), while those living below or close to the [poverty level](#) had the lowest prevalence (6.8 percent).

"States can use the findings to guide their programs, communications and social marketing, and policies to support improving [fruit](#) and vegetable access and intake," the authors write.
