

Measles deaths fall by over 70% in last decade, WHO reports

17 January 2013

The global number of measles deaths dropped by 71 percent between 2000 and 2011 largely thanks to a boost in vaccination efforts, the UN World Health Organisation said Thursday.

The number of mortalities from measles over that period fell from 542,000 to 158,000, it said in a statement, while the number of new cases fell by 58 percent to 355,000 in 2011.

The UN health agency recommends that all children receive two doses of [measles vaccine](#) to be protected from the highly contagious disease.

But despite high-profile vaccination campaigns, the vaccine has yet to reach all those in need. The WHO estimates that 20 million children worldwide failed to receive first dose of the vaccine in 2011.

More than half live in India (6.7 million children), Nigeria (1.7 million), Ethiopia (one million), and Pakistan (900,000) and the [Democratic Republic of Congo](#) (800,000).

In 2011, these five countries experienced large outbreaks of measles, while thousands of cases were also recorded in other countries including France, Italy and Spain.

Most of these countries have committed to eradicating measles by 2015 or 2020.
