(HealthDay)—For patients with cancer, use of herbal medicine has associated safety-related concerns, including direct toxic effects and increased chemosensitivity of cancer cells, according to a study published online Nov. 24 in *Cancer*.

Eran Ben-Arye, M.D., from the Lin Medical Center in Haifa, Israel, and colleagues examined the use of [herbal medicine](#) by Middle Eastern patients with [cancer](#), using a 17-item questionnaire that was administered by oncology health care professionals (HCPs). The literature was reviewed to assess potential negative effects associated with [herbal products](#) identified by the study HCPs.

The researchers found that 44 herbal and three non-herbal nutritional supplements were identified by 339 HCPs who completed the study questionnaire (response rate, 80.3 percent). Twenty-nine products had associated safety-related concerns, including herb-drug interactions with altered pharmacodynamics, direct toxic effects, and increased in vitro response of [cancer cells](#) to chemotherapy (15, 18, and seven herbs, respectively).

"Oncology HCPs working in countries in which herbal medicine use is prevalent need to better understand the implications of this practice," the
