

Community pharmacists play role in providing preventive care

November 2 2016

(HealthDay)—Community pharmacists are well suited to provide

clinical preventive services, including education, screenings, and making referrals, according to a report published in the Oct. 27 issue of the U.S. Centers for Disease Control and Prevention's *Preventing Chronic Disease*.

Sarah E. Kelling, Pharm.D., M.P.H., from the University of Michigan in Ann Arbor, and colleagues conducted a systematic literature review and a review of U.S. Preventive Services Task Force recommendations rated A or B to document examples of the community pharmacist's role in providing clinical preventive services to the <u>general population</u>.

The researchers note that there are several clinical preventive services that can be offered by <u>community pharmacists</u>. They focused on specific services: providing education, conducting screenings, and making referrals to improve <u>population health</u>. Interventions can be beneficial in aspects of care, including folic acid education, tobacco use cessation, and osteoporosis and HIV screening.

"As part of interdisciplinary teams and clinical-community links, community pharmacists can improve population health through provision of clinical preventive services," the authors write.
