

## 7 common exercise errors

May 9 2017, by Julie Davis, Healthday Reporter

---

(HealthDay)—Are you sabotaging your exercise goals? Avoid these common mistakes.

**Mistake No. 1:** Not keeping an exercise chart or journal. A record tells you how far you've come and when it's time to go to the next level. Noting improvements in your [heart rate](#) will also provide motivation. Check it 15 to 60 minutes after exercising—you'll see a decrease in this number as your heart gets stronger.

**Mistake No. 2:** Not writing down goals. Studies show that people who chart short- and long-term goals accomplish more of them.

**Mistake No. 3:** Strength-training the same muscles on consecutive days. This prevents proper recovery and growth. Allow one to two days before working the same [muscle groups](#).

**Mistake No. 4:** Holding your breath. Proper breathing is almost as important as proper form. Exhale as you lift, and inhale as you lower.

**Mistake No. 5:** Not eating enough protein. To lose weight and tone up, your plan should include cardio, strength training and a lower-calorie diet that's high in protein—about three-quarters of a gram per pound of your ideal body weight. More [protein](#) enhances the effects of exercise and decreases fat without [muscle loss](#).

**Mistake No. 6:** Being distracted during workouts. Reading or watching a complex TV show can actually slow your pace. Instead, listen to energetic music or try a sitcom (just be sure to place the screen at eye level for better performance).

**Mistake No. 7:** Ignoring flexibility and balance training. Both are key to overall fitness.

**More information:** The American College of Sports Medicine has 10 do's to [get your exercise routine on track](#).
