

Moderate alcohol consumption tied to lower heart failure risk

16 October 2017

regular or only-wine drinkers or according to sex, age, social status, or adherence to a Mediterranean diet was associated with very similar results.

"Consumption of alcohol in moderation was associated with a lower incidence of heart failure but not with development of [atrial fibrillation](#)," the authors write.

The study was funded in part by Pfizer.

(HealthDay)—Moderate alcohol consumption is associated with reduced risk of heart failure but not atrial fibrillation (AF), according to a study published online Oct. 11 in *JACC: Heart Failure*.

Augusto Di Castelnuovo, Ph.D., from the IRCCS Istituto Neurologico Mediterraneo NEUROMED in Italy, and colleagues analyzed 22,824 individuals from the general population with complete data on [heart failure](#), AF, and [alcohol consumption](#). Participants were followed for a median of 8.2 years (183,912 person-years).

The researchers identified 943 and 554 incident cases of heart failure and AF, respectively, during follow-up. Both former and occasional drinkers showed a risk of developing heart failure that was comparable to never drinkers. Drinking one to four drinks/day was associated with a [reduced risk](#) of heart failure, with a maximum risk reduction of 22 percent at 20 g/day independent of confounders. There was no correlation for alcohol consumption with AF onset. Restriction of the analyses to
