

# Breast implants slightly increase risk of breast ALCL

5 January 2018

ALCL cases, implants were more often macrot textured (23 macrot textured of 28 total implants of known type; 82 percent) compared to what might be expected based on sales data (45 percent). The cumulative risks of breast-ALCL in women with implants were 29 per million at 50 years old and 82 per million at 70 years old. To cause one breast-ALCL case before age 75 years, the number of women with implants needed was 6,920.

"Our results emphasize the need for increased awareness among the public, medical professionals, and regulatory bodies; promotion of alternative cosmetic procedures; and alertness to signs and symptoms of breast-ALCL in women with implants," the authors write.

Mintsje de Boer, M.D., from the Maastricht University Medical Centre in the Netherlands, and colleagues used data from the nationwide Dutch pathology registry to identify all patients diagnosed with primary non-Hodgkin [lymphoma](#) in the breast between 1990 and 2016. In addition, clinical data, including breast implant status, were obtained from treating physicians. The authors used a case-control design to compare [implant](#) prevalence between women with breast-ALCL and those with other types of breast lymphoma.

The researchers found that 32 of the 43 patients with breast-ALCL (median age, 59 years) had ipsilateral breast implants, compared with one case among 146 women with other primary breast lymphomas (odds ratio, 421.8). Among breast-
