Data from the 2019 Monitoring the Future Survey of eighth, 10th and 12th graders show alarmingly high rates of e-cigarette use compared to just a year ago, with rates doubling in the past two years. University of Michigan, Ann Arbor, scientists who coordinate and evaluate the survey released the data early to *The New England Journal of Medicine (NEJM)*

to notify public health officials working to reduce vaping by teens. The survey is funded by the National Institute on Drug Abuse (NIDA), part of the National Institutes of Health.

The new data show a significant increase in past month vaping of [nicotine](#) in each of the three grade levels since 2018. In 2019, the prevalence of past month nicotine vaping was more than 1 in 4 students in 12th grade; 1 in 5 in 10th grade, and 1 in 11 in eighth grade.

"With 25% of 12th graders, 20% of 10th graders and 9% of eighth graders now vaping nicotine within the past month, the use of these devices has become a public health crisis," said NIDA Director Dr. Nora D. Volkow. "These products introduce the highly addictive chemical nicotine to these young people and their developing brains, and I fear we are only beginning to learn the possible health risks and outcomes for youth."

"Parents with [school-aged children](#) should begin paying close attention to these devices, which can look like simple flash drives, and frequently come in flavors that are appealing to youth," said University of Michigan lead researcher Dr. Richard Miech. "National leaders can assist parents by stepping up and implementing policies and programs to prevent use of these products by teens."

Additional findings from the 2019 Monitoring the Future Survey, documenting the use of and attitudes about marijuana, alcohol and other drugs, will be released in December.
