

# Convalescent plasma appears promising for severe COVID-19

18 May 2020

improvement in clinical status by day 14, and 11 were discharged. There were no adverse events observed as a result of plasma transfusion. On [whole genome](#) sequencing, no strain genotype-disease severity correlation was identified.

"Convalescent plasma therapy has been administered on the front lines during emergencies, and we and others recognize the need for controlled [clinical trials](#) to determine its therapeutic efficacy," the authors write.

(HealthDay)—Administration of convalescent plasma seems safe and results in improvement in clinical status for patients with severe or life-threatening COVID-19, according to a study not yet peer reviewed and posted on medRxiv.org.

For the study, Eric Salazar, M.D., Ph.D., from Houston Methodist Hospital, and colleagues enrolled 25 patients with severe or life-threatening COVID-19 from March 28 to April 14, 2020. Convalescent plasma was obtained from donors with confirmed severe acute respiratory syndrome coronavirus 2 who had been symptom-free for 14 days and was then transfused into patients.

All patients were receiving supportive care at baseline, including anti-inflammatory and antiviral treatments; all patients were on oxygen support. The researchers found that nine patients had at least a 1-point improvement in the clinical scale at day 7 after transfusion with [convalescent plasma](#); seven of these patients were discharged. Nineteen [patients](#) (76 percent) had at least a 1-point
