The percentage of low- and middle-income families with children that had burdensome out-of-pocket health care costs fell following the 2014 implementation of the health insurance marketplaces and Medicaid expansion provisions of the Affordable Care Act, known widely as Obamacare, according to a new study by Lauren Wisk, an assistant professor at the David Geffen School of Medicine at UCLA, and colleagues.

Before the ACA, the study shows, 35.6% of the lowest-income families experienced burdensome costs, but this fell to 23.7% post-ACA. For [low-income families](#), the proportion fell from 24.6% to 17.3%, and for middle-income families, it decreased from 6.1% to 4.6%. The proportion of high-income families with burdensome costs remained relatively stable over time, at 1.1% pre-ACA and 0.9% post-ACA.

Most studies of the financial impacts of the ACA have focused on adults or groups that were directly targeted by individual ACA provisions, such as young adults or dependents affected by the dependent coverage expansion. This is the first

study to examine how these policies impacted coverage and costs for families with children, and it shows that the ACA benefitted low- and middle-income children by reducing the burden of health care costs for their families.

The researchers examined data from the 2000-2017 Medical Expenditure Panel Survey for more than 92,000 families with one or more children under the age of 18 and one or more adult parents or guardians. Families with out-of-pocket health care costs exceeding an established percentage of their annual income (for example, 3.45% of annual incomes below \$20,000, or 8.35% of those at \$75,000), were classified as experiencing high financial burdens. Those whose out-of-pocket costs exceeded 10% of their annual income were classified as experiencing extreme financial burdens.

Lowest-income families are those living at or below 138% of the [federal poverty level](#), low-income families are at 139% to 250% and middle-income families are at 251% to 400%.

The researchers lacked data on which families lived in Medicaid-expansion states, and eligibility groups were identified based on self-reported [family structure](#) and income rather than on exact program eligibility criteria, which could limit the study's findings.

The ACA substantially improved access to insurance, both public and private, and was associated with a large reduction in health care [costs](#) and financial burdens for families with [children](#). But low- and middle-income families are still vulnerable to high financial burdens, and more work is needed to reduce the financial strain for these families.

The study is published in the peer-reviewed journal *JAMA Pediatrics*.

Study authors are Lauren Wisk of UCLA and Dr. Alon Peltz and Dr. Alison Galbraith of Boston Children's Hospital. All are also affiliated with Harvard Medical School.
