

# Treatment success seen with antibiotics for uncomplicated appendicitis

12 January 2021

The researchers found that the [treatment success](#) rate at one year was 70.2 and 73.8 percent for patients treated with oral antibiotics and intravenous followed by [oral antibiotics](#), respectively. The difference was 3.6 percent ( $P = 0.26$  for noninferiority), with the confidence limit exceeding the margin for noninferiority.

"The current evidence supports that patients with uncomplicated appendicitis should be offered a treatment choice between surgery and antibiotics alone," write the authors of an accompanying editorial. "The key to moving forward is getting that evidence into practice."

Several authors disclosed financial ties to the [pharmaceutical industry](#).

(HealthDay)—For adults with uncomplicated acute appendicitis, treatment success rates 65 percent are seen with both oral antibiotics and combined intravenous and oral antibiotics, according to a study published online Jan. 11 in the *Journal of the American Medical Association*.

Suvi Sippola, M.D., from Turku University Hospital in Finland, and colleagues compared oral antibiotics to combined intravenous followed by oral antibiotics in 599 [patients](#) aged 18 to 60 years with computed tomography-confirmed uncomplicated acute appendicitis. Participants were randomly assigned to either oral moxifloxacin for seven days or intravenous ertapenem for two days followed by oral levofloxacin and metronidazole for five days. Overall, 581 patients were available for one-year follow-up. The primary end point was treatment success (65 percent); a margin of 6 percent for the difference between the treatment groups was used to determine noninferiority of oral antibiotics alone.
