

EMA has 'not yet reached conclusion' on AstraZeneca

6 April 2021

"In my opinion, we can say it now, it is clear there is a link with the vaccine," Cavaleri told Italy's *Il Messaggero* newspaper in an interview. "But we still do not know what causes this reaction."

After several countries suspended the use of the AstraZeneca jab, the EMA said on March 18 that the benefits of using it outweighed the risks and it should remain in use.

But it has said there is a possible link to rare blood clots and that it would issue updated advice during this week's meeting of its safety committee.

The EU's drug regulator said Tuesday it is still deciding whether the AstraZeneca coronavirus vaccine causes blood clots, after one top official said there was a clear link.

The European Medicines Agency's safety committee "has not yet reached a conclusion and the review is currently ongoing", the Amsterdam-based EMA said in a statement to AFP.

"We will communicate and hold a press briefing as soon as the review is finalised. This is currently expected tomorrow (Wednesday, 7 April) or on Thursday, 8 April," it added.

EU Health Commissioner Stella Kyriakides later said that the agency was expected to make its decision "late Wednesday", adding that she was in "close contact" with the EMA.

The statement came after the EMA's head of vaccine strategy Marco Cavaleri was quoted in Italian media as saying that there was a "clear" connection and that the agency would announce it within hours.
