

# Study finds that blocking seats on planes reduces virus risk

15 April 2021, by The Associated Press

In this Wednesday, Feb. 3, 2021, file photo, a passenger wears a face mask she travels after take off from Hartsfield-Jackson International Airport in Atlanta. A new study says leaving middle seats open could reduce the risk of airline passengers contracting the virus that causes COVID-19. The study was published Wednesday, April 14, 2021 by researchers from the U.S. Centers for Disease Control and Prevention and Kansas State University. (AP Photo/Charlie Riedel, File)

A new study says leaving middle seats open could give airline passengers more protection from the virus that causes COVID-19.

Researchers said the risk of passengers being exposed to the virus from an infected person on the plane could be reduced by 23% to 57% if middle seats are empty, compared with a full flight.

The [study released Wednesday](#) supports the response of airlines that limited seating early in the pandemic. However, all U.S. airlines except Delta now sell every seat they can, and Delta will stop blocking middle seats on May 1.

The airlines argue that filters and air-flow systems on most planes make them safe when passengers

wear face masks, as they are now required to do by federal regulation.

Researchers at the U.S. Centers for Disease Control and Prevention and Kansas State University estimated how far airborne virus particles travel inside a [plane](#). They used mannequins that emitted aerosol to measure the flow of virus particles through airline cabin mock-ups.

The study, however, did not take into account the wearing of face masks because it was based on a previous study done in 2017, before the pandemic.

Nor did it consider whether passengers are vaccinated against COVID-19. The CDC says [vaccinated people can travel at low risk](#) to themselves, although the agency still recommends against nonessential travel.

Airlines for America, a [trade group](#) for the largest U.S. carriers, said airlines use several layers of measures to prevent the spread of the [virus](#) on planes, including face masks, asking passengers about their health, and stepped-up cleaning of cabins. The group cited a Harvard University report funded by the [airline industry](#) as showing that the risk of transmitting the coronavirus on planes is very low.

Airlines were divided last year over filling middle seats. While Delta, Southwest, Alaska and JetBlue limited seating on planes, United Airlines never did and American Airlines only blocked seats for a short time. It was mostly an academic question, because relatively few flights last year were crowded. That is changing.

More than 1 million travelers have gone through U.S. airports each day for the past month. While that is still down more than one-third from the same period in 2019, more flights now are crowded. Around Easter weekend, Delta [temporarily filled middle seats](#) to accommodate passengers whose

original flights were canceled because of staffing shortages.
