from England.

The authors of both articles stress that [clinicians](#) should be vigilant in looking for this rare neurological syndrome following administration of COVID-19 vaccines.

Christopher Martin Allen et al, Guillain-Barré syndrome variant occurring after SARS-CoV-2 vaccination, *Annals of Neurology* (2021). [DOI: 10.1002/ana.26144](https://doi.org/10.1002/ana.26144)

In two separate articles in the *Annals of Neurology*, clinicians in India and England report cases of a rare neurological disorder called Guillain-Barré syndrome after individuals were vaccinated against COVID-19.

Provided by Wiley

Both reports describe an unusual variant of Guillain-Barré [syndrome](#) characterized by prominent facial weakness. Seven cases were reported from a regional medical center in Kerala, India, where approximately 1.2 million people were vaccinated with the AstraZeneca COVID-19 vaccine. Four cases were reported from Nottingham, England, in an area in which approximately 700,000 people received the same vaccine. All eleven cases were among people who had received that vaccine between 10 and 22 days earlier.

The frequency of Guillain-Barré syndrome in these areas was estimated to be up to 10 times greater than expected.

"If the link is causal it could be due to a cross-reactive immune response to the SARS-CoV-2 spike protein and components of the peripheral immune system," wrote the authors of the report
