Researchers at the Centenary Institute and the University of Technology Sydney have identified a new drug target for the treatment and prevention of chronic obstructive pulmonary disease (COPD), an

inflammatory lung disease that causes airway blockage and that makes it difficult to breathe.

Secreted by [mast cells](#), a part of the immune system, the [drug target](#) is an enzyme known as mast cell chymase-1 (CMA1).

CMA1 was found by the researchers to actively promote and progress the development of COPD. Inhibiting the equivalent enzyme in mice was shown to provide protection in experimental models of COPD. New drugs targeting CMA1, said the researchers, could offer up a new therapeutic approach to tackling COPD which affects more than 300 million people globally.

Dr. Gang Liu, the study's lead author and researcher at the Centenary UTS Center for Inflammation said that COPD was caused by [cigarette smoke](#), air pollution, as well as bushfire smoke and other [particulate matter](#).

"Over time the lungs breathe in toxic material and become inflamed. Lung function is subsequently impaired leading to breathing difficulties which can then turn fatal," said Dr. Liu.

In their new study, the researchers discovered elevated CMA1 levels in the lung tissues of patients with severe COPD—the CMA1 levels were approximately double that found in the lung tissue of mild-COPD patients and healthy individuals.

"CMA1 induces macrophages (a type of white blood cell) to release pro-inflammatory cytokines in the lung. It's this increased inflammation that can drive the development of COPD and poor outcomes for patients," said Dr. Liu.

Subsequent investigation of the equivalent CMA1 enzyme found in

mice—an enzyme known as mMCP5—confirmed the enzyme's pivotal role in COPD.

"We were able to show in experimental COPD, that inhibiting mMCP5 provided protection against inflammation and macrophage accumulation, harmful structural changes of the lung, emphysema and impaired [lung function](#)," Dr. Liu said.

Professor Phil Hansbro, the study's senior author and Director of the Centenary UTS Center for Inflammation said the team's research offered up a new therapeutic target to help combat COPD.

"There is currently no cure for COPD and effective therapies to treat and manage the disease are urgently needed. Our study suggests that developing [new drugs](#) to inhibit CMA1 and reduce cytokine inflammation may be a novel treatment for this devastating disease that affects so many lives," Professor Hansbro said.

The study was published in the *European Respiratory Journal*.
